

Probabilistic Analysis of Occurrences of Fecal Indicator Bacteria in Rincón Public Beach

Mary C. Acosta-Cervantes, Sylvia Rodríguez-Abudo, Priscila Vargas-Babilonia Caribbean Coastal Ocean Observing System, University of Puerto Rico at Mayagüez UPRM Center for Applied Ocean Science Engineering, Department of Engineering Science and Materials

This work describes the analyses of ~4 years of beach water quality data at Rincón Public Beach. Given that rainfall has been found to be the strongest indicator of Fecal Indicator Bacteria (FIB) in beach water (see Vargas and Rodríguez and Tamar et al. posters), this effort includes an assessment of precipitation information from a nearby Weather Underground station.

FIB data from SURFRIDER FOUNDATION and CARICOOS: <u>www.surfrider.org/blue-</u> <u>water-task-force/chapter/4</u> (March 21, 2012 - April 18, 2016)

Precipitation from Weather Underground Station KPRRINCO3: https://www.wunderground.com/personal-weatherstation/dashboard?ID=KPRRINCO3

Summary and Future (Ongoing) Work

Given that rainfall is a good predictor of FIB in Rincón Public Beach, a probabilistic analysis of FIB following rainfall events was performed. The analysis shows strong statistics (errors of 4%) for cases of no rainfall, indicating confidence on the binary model for this case. However, due to the small number of available data sets after rainfall events, and subsequent errors of roughly 14%, more sampling is needed in order to develop the binary model for this case.
